# JAVASCRIPT

THE SCRIPTING LANGUAGE FOR WEB PROGRAMMING

# JAVASCRIPT FUNDAMENTALS

A BRIEF INTRODUCTION TO JAVASCRIPT

## WHAT IS JAVASCRIPT?

JAVASCRIPT IS A <u>HIGH-LEVEL</u>, <u>OBJECT-ORIENTED</u>, <u>MULTI-PARADIGM</u> <u>PROGRAMMING LANGUAGE</u>. We don't have to worry about complex stuff like memory management

We can use different styles of programming

Based on objects, for storing most kinds of data

Instruct computer to do things

## JAVASCRIPT FEATURES

PROTOTYPE-BASED HIGH-LEVEL MULTI-PARADIGM OBJECT-ORIENTED INTERPRETED OR JUST-IN-TIME DYNAMIC SINGLE-THREADED COMPILED NON-BLOCKING FIRST-CLASS **GARBAGE-EVENT LOOP FUNCTIONS COLLECTED** 

#### THERE IS NOTHING YOU CAN'T DO WITH JAVASCRIPT

**FRONT-END APPS** 

Dynamic effects and web applications in the browser

JS 🔯 🗚 💙

100% based on JavaScript. They might go away, but JavaScript won't!

Native mobile applications

**BACK-END APPS** 

Web applications on web servers

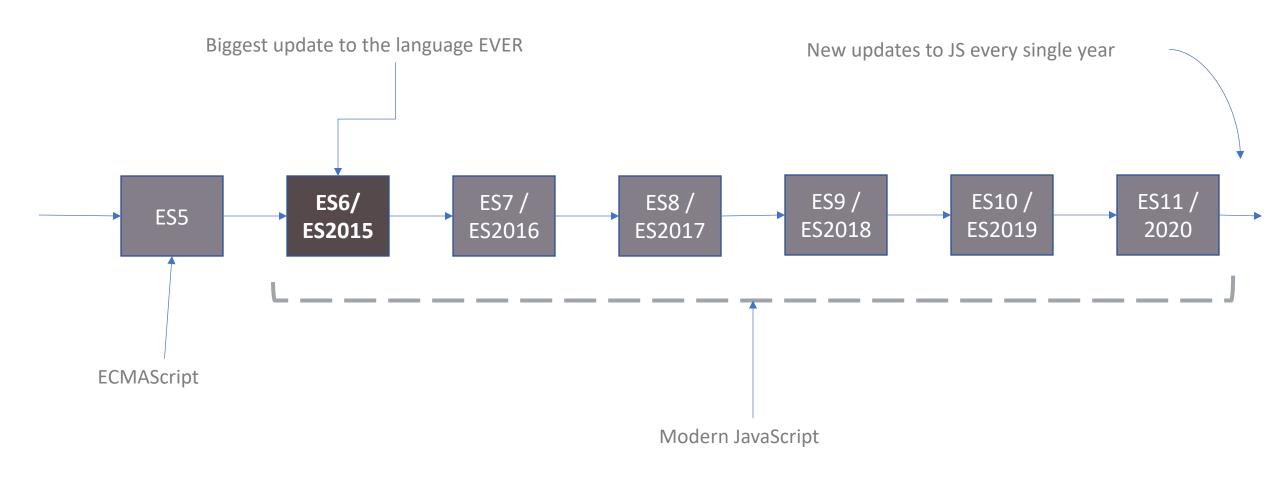

Native desktop applications

## JAVASCRIPT RELEASES...

## A BRIEF HISTORY OF JAVASCRIPT

Brendan Eich creates the very first version of JavaScript in just 10 days. It was called Mocha.

Mocha changes to LiveScript and then to JavaScript, in order to attract Java developers.

Microsoft launches IE, copying JavaScript from Netscape and calling it JScript;

With a need to standardize the language, ECMA releases ECMAScript 1 (ES1), the first official standard for JavaScript (ECMAScript is the standard, JavaScript the language in practice)

ES5 (ECMAScript 5) is released with lots of great new features

1996

1997

2009

2015

2016

onwards

ES6/ES2015 (ECMAScript 2015) was released: the biggest update to the language ever! ECMAScript changes to an annual release cycle in order to ship less features per update

Release of ES2016 / ES2017 / ES2018 / ES2019 / ES2020 / ES2021 / ... / ES2089

# JAVASCRIPT NEW FEATURES

**ES6 AND MORE** 

## ES6 & MORE – NEW FEATURES

ARROW FUNCTION

DESTRUCTURING

REST / SPREAD

TEMPLATE LITERALS

**BLOCK SCOPING** 

MAP/SET

CLASSES

DEFAULT PARAMETERS

## ARROW FUNCTION =>

Arrow functions are handy for one-liner functions

A				
Arrow	HIIN	nction	FI21	<i>i</i> nrc
$\Delta II \cup VV$	ı uı	ICCIOII	Ha	<b>7013</b>

#### Limitations

Without Curly braces ( ...args ) => expression

Don't have this keyword

Don't have arguments keyword

With curly braces ( ...args ) => { body

Cant call with new operator

## **BLOCK SCOPING**

Restricts the scope of variables to the nearest curly braces { }

## Variables Types

const: converts the variable to a constant

**let**: for all type of variables

const !== immutable

## REST / SPREAD OPERATOR

#### **REST**

A function can be called with any number of arguments, no matter how it is defined.

The rest parameters must be at the end.

Usage: create functions that accept any number of arguments

#### **SPREAD**

Spread operator looks similar to rest parameters, also using (...), but does quite the opposite.

It is used in the function call, it "expands" an iterable object into the list of arguments.

Usage: pass an array to functions that normally require a list of many

#### DESTRUCTURING

Destructuring assignment is a special syntax that allows us to "unpack" arrays or objects into a bunch of variables.

#### **OBJECT DESTRUCTURING**

• We have an existing object at the right side, that we want to split into variables.

#### ARRAY DESTRUCTURING

• The array is destructured into variables, but the array itself is not modified.

#### **NESTED DESTRUCTURING**

• If an object or an array contain other objects and arrays, we can use more complex left side patterns to extract deeper portions.

# ASYNCHRONOUS JAVASCRIPT

PROMISES, ASYNC/ AWAIT AND MORE

#### SYNCHRONOUS CODE

```
const p = document.querySelector("#paragraph");
p.textContent = "Hello World";
alert("Who's this?");
p.style.color = "red";
```

Most code is synchronous

Synchronous code is executed line by line

Each line of code waits for previous line to finish

Long-running operations block code execution

## ASYNCHRONOUS CODE

```
const p = document.querySelector("#paragraph");
setTimeout(() => {
    alert("Who's this?")
}, 1000);
p.style.color = "red";
```

Asynchronous code is executed after a task that runs in the "background" finishes

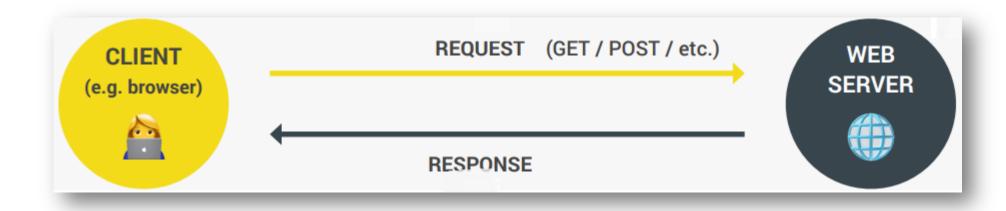

Asynchronous code is non-blocking

Execution doesn't wait for an asynchronous task to finish its work

Callback functions alone do NOT make code asynchronous

#### WHAT ARE AJAX CALLS?

Asynchronous JavaScript And XML: Allows us to communicate with remote web servers in an asynchronous way. With AJAX calls, we can request data from web servers dynamically

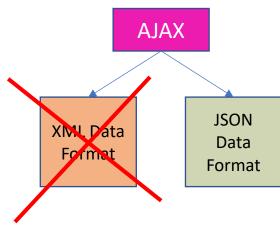

## WHAT IS AN API?

Piece of software that can be used by another piece of software, in order to allow applications to talk to each other

There are be many types of APIs in web development: DOM API, Geolocation API, Books API, Online API etc

"Online" API: Application running on a server, that receives requests for data, and sends data back as response

We can build our own web APIs (requires back-end development, e.g. with node.js) or use 3rd-party APIs

Examples of 3<sup>rd</sup> Party APIs

Weather data

Data about countries

Flights data

Currency conversion data

APIs for sending email or SMS

Google Maps

Millions of possibilities.

#### WHAT ARE PROMISES?

Promise: An object that is used as a placeholder for the future result of an asynchronous operation.

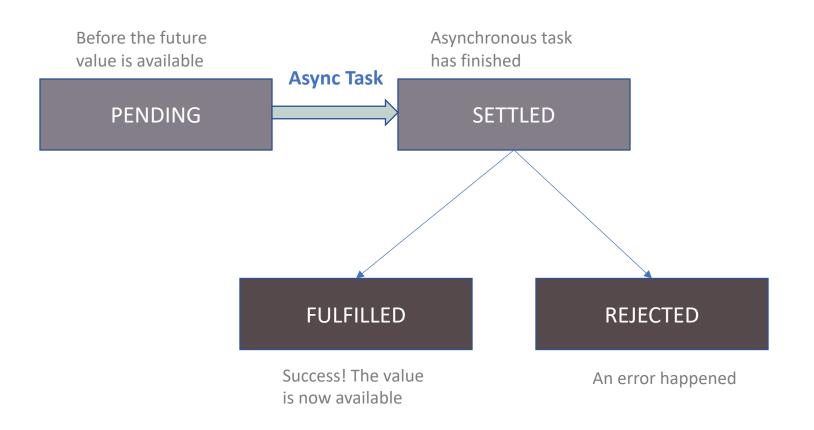

Promise: A container for an asynchronously delivered value.

Promise: A container for a future value.

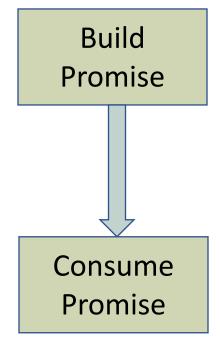

We no longer need to rely on events and callbacks passed into asynchronous functions to handle asynchronous results;

Instead of nesting callbacks, we can chain promises for a sequence of asynchronous operations: escaping callback hell

## THE PROMISE LIFECYCLE

E.g. Fetch API returns promise

When we already have a promise.
E.g. promise returned from Fetch API

# MODERN JAVASCRIPT DEVELOPMENT

WRITING CLEAN AND MODERN JAVASCRIPT

## REVIEW: MODERN AND CLEAN CODE

#### READABLE CODE

- Write code so that others can understand it
- Write code so that you can understand it in 1 year
- Avoid too "clever" and overcomplicated solutions
- Use descriptive variable names: what they contain
- Use descriptive function names: what they do

#### **FUNCTIONS**

- Generally, functions should do only one thing
- Don't use more than 3 function parameters
- Use default parameters whenever possible
- Generally, return same data type as received
- Use arrow functions when they make code more readable

## REVIEW: MODERN AND CLEAN CODE

#### **GENERAL**

- Use DRY principle (refactor your code)
- Don't pollute global namespace, encapsulate instead
- Don't use var
- Use strong type checks (=== and !==)

#### OOP

- Use ES6 classes
- Encapsulate data and don't mutate it from outside the class
- Implement method chaining
- Do not use arrow functions as methods (in regular objects)

#### REVIEW: MODERN AND CLEAN CODE

#### **AVOID NESTED CODE**

- Use early return (guard clauses)
- Use ternary (conditional) or logical operators instead of if
- Use multiple if instead of if/else-if
- Avoid for loops, use array methods instead
- Avoid callback-based asynchronous APIs

#### **ASYNCHRONOUS CODE**

- Consume promises with async/await for best readability
- Whenever possible, run promises in parallel (Promise.all)
- Handle errors and promise rejections
